Hi Lizzie,

That's a pity you could not join to the IPCHS. It was quite fruitfull and one important point was to make a bridge between this community and phenology people. We had Yann Vitasse, Benedicte Wenden, and some other people interested in phenology and dormancy.

Back to your initial request, no problem for sharing this data, that brings me back to my PhD. I used them in this paper as well to fit a sigmoid function.

Charrier G., Chuine I., Bonhomme M., & Améglio T. (2018). Assessing frost damages using dynamic models in walnut trees: exposure rather than vulnerability controls frost risks. *Plant, Cell & Environment*, 41(5), 1008–1021.

Is it ok in this shape ? Can you tell me a bit more about the project to see if I have other data that may fit as well?

Cheers

Guillaume

Dear Dr. Charrier,

I do not think we have ever met, but I have long appreciated your work. I was hoping we might meet this year -- I wanted to attend the IPCHS, but could not make the timing work.

I am writing now as I am working to test models of leafout combining observational and experimental data and your data in the attached remains one of the best tests of different forcing levels. I was wondering if you have the raw data underlying this experiment and would consider sharing it? I'd be happy to answer any questions about the project.

All the best,

Lizzie
